

Eversolo Officially Supports Spotify Connect Lossless Streaming, Delivering 24-bit/44.1kHz High-Fidelity Experience

Eversolo has officially released the V1.5.60 system update, bringing highly anticipated Spotify Connect lossless playback support to its products. This upgrade enables Spotify Connect to now transmit 24-bit/44.1kHz high-quality audio, offering users a purer, more detailed, and layered music experience.

As one of the largest music platforms globally, Spotify's convenience is already deeply ingrained in users. The introduction of lossless audio quality elevates Eversolo's streaming experience to a higher standard. Not only does it preserve Spotify's original operation habit, but it also unleashes the full potential of hardware in terms of resolution, dynamics, and sound reproduction.

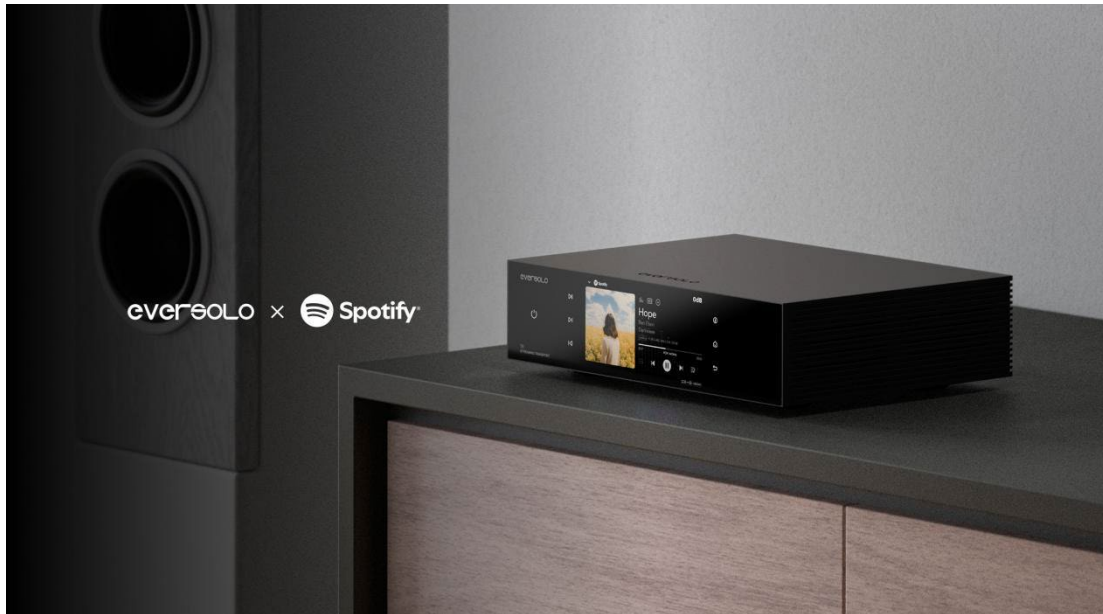

Through continuous optimization of system architecture and audio pathways, Eversolo ensures more stable transmission and purer signal performance for Spotify Connect lossless playback, allowing users to experience high-fidelity audio within the familiar Spotify ecosystem.

The V1.5.60 update is now available for the following models:

- DMP Series
- T8
- Play Series

The system update will be gradually rolled out via OTA. Once upgraded, users can enjoy a higher-spec lossless music playback experience directly through Spotify Connect in the Spotify app.

Eversolo will continue optimizing both software and hardware capabilities, system stability, and audio performance to create a more complete and professional digital music playback ecosystem.
